                                                         The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve avulsion, and effects motoneurone rescue, preferably adult motoneurone rescue. The MGF polymucleotide and polypeptide are useful in the CR manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, ce e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, cor poliomyelitis or post-polio syndrome, a disorder caused by exposure to a coxin, motoneurone trauma, a motoneurone lesion or nerve damage, an cor injury that affects motoneurones, motoneurone loss associated with aging, autosommal or sex-linked muscular dystrophy, diabetic neuropathy, present sequence is human IGF-I isoform MGF. MGF is a muscle isoform CR present sequence is human IGF-I isoform MGF. MGF is a muscle isoform CR MGF protein comprises amino acid sequences encoded by nucleic acid sequence of IGF-I exons 4, 5 and 6 in the reading frame of MGF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mechano-growth factor; neurological disorder; neurodegenerative disorder; amyotrophic lateral solerosis; spinal muscular atrophy; muscular atrophy; poliomyelitis; post-polio syndrome; toxin; motoneurone disorder; nerve damage; autosomal muscular dystrophy; diabetic neuropathy; sex-linked muscular dystrophy; peripheral neuropathy; Alzheimer's disease; Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 4; Page 50-51; 66pp; English.

                                           The invention relates to the use of an insulin-like growth factor I (IGF-I) isoform, known as mechano-growth factor (MGP), in the manufacture of a medicament for treating nerve damage in the peripheral nervous system, or for treating nerve damage by localising MGP at the site of damage. The nerve damage may include severing of a nerve. The treatment may be combined with another treatment (such as a polypeptide growth factor other than MGP) that prevents or diminishes degeneration of the target organ (for example, muscle) which the damaged nerve innervates, whereby the treatment of the muscle with MGP or a polynucleotide encoding MGP prevents or diminishes degeneration. The method is useful for treating neurological disorders, preferably motorneuron disorders. These methods can reduce motoneuron loss by 20% or greater in response to nerve avulsion. This sequence represents the human MGP polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 200

                                                                                                                                                                                       The present sequence is that of the C-terminal end of novel human mechano growth factor (MGF), encoded by exons 3-6 off the IGF-I gene. MGF is a splice variant and non-liver type isoform of insulin-like growth factor (IGF-I) that is activated in response to cardiac tissue damage and which has a repair function in the ischaemic and/or overloaded heart. The human MGF transcript has a 49 base insert in the E domain that alters the reading frame and hence the C-terminal end of MGF protein in comparison with other IGF-I splice variants. The invention provides use of a MGF polypeptide or polymucleotide in the manufacture of a medicament for the prevention or limitation of myocardial damage in response to ischaemia or the myocardium. The MGF polypeptide, polymucleotide or medicament is also useful for administration in response to a heart attack
                                                                                                                                                                 Sequence 110

The radiolabeled 42 mer was then employed to screen for IGF-I containing DNA sequences in a human liver cDNA library. Insulin-like growth factors -1A and -1B cDNAs were isolated from a human cDNA library by using lambdagt 11 (AAN70435, AN70435). The human IGF-I genomic gene was isolated and mapped. It encodes at least two preproinsulin-like growth factor-1 proteins. An essentially pure proproinsulin-like growth factor-1 groteins comprising the sequence of amino acids shown in Figure six is claimed (AAP70277). (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New pre-pro-insulin-like growth factor-1 protein - obtd. DNA procedures for use as growth promoters for enhancing stimulating cell proliferation etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;

The MGF polynucleotide and polypeptide are useful in the manufacture of a medicament for the treatment of a neurological disorder, including a disorder of motoneurones and/or neurodegenerative disorder, e.g., amyotrophic lateral sclerosis, spinal muscular atrophy, progressive spinal muscular atrophy, infantile or juvenile muscular atrophy, progressive poliomyelitis or post-polio syndrome, a disorder caused by exposure to a toxin, motoneurone trauma, a motoneurone lesion or nerve damage, an injury that affects motoneurones, motoneurone loss associated with aging, autosomal or sex-linked muscular dystrophy, diabetic neuropathy, peripheral neuropathies, Alzheimer's disease and Parkinson's disease. The present sequence is human liver-type IGF-I isoform (L.IGF-I). The L.IGF-I

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to use of mechano-growth factor (MGF), an Insulin-like Growth Factor-I (IGF-I) isoform in the manufacture of a medicament for the treatment of neurological disorder. The MGF is capable of reducing motoneurone loss by 20% or greater in response to nerve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of mechano-growth factor, an isoform of Insulin-like Growth Factor-I, capable of reducing motoneurone loss, in the manufacture of a medicament for the treatment of neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Fig

The invention relates to the use of an insulin-like growth factor I (IGF-I) isoform, known as mechano-growth factor (MGF), in the manufacture of a medicament for treating nerve damage in the peripheral nervous system, or for treating nerve damage by localising MGF at the site of damage. The nerve damage may include severing of a nerve. The treatment may be combined with another treatment (such as a polypeptide growth factor other than MGF) that prevents or diminishes degeneration of the target organ (for example, muscle) which the damaged nerve innervates, whereby the treatment of the muscle with MGF or a polynucleotide encoding MGF prevents or diminishes degeneration. The method is useful for treating neurological disorders, preferably motorneuron disorders. These methods can reduce motoneuron loss by 20% or greater in response to nerve avulsion. This sequence represents the human insulin-like growth factor I liver-type isoform (L.IGF-I) used in experiments on motoneuron loss

It is encoded by exons 3, 4 and 6 of the IFG-1 gene. The invention relates to a novel IGF-1 splice variant, denoted mechano growth factor, a non-liver type isoform of IGF-1 that is activated in response to cardiac tissue damage and which has a repair function in the isohaemic and/or overloaded heart. The human MGF transcript has a 49 base insert in the E domain that alters the reading frame and hence the C-terminal end of MGF protein in comparison with other IGF-1 splice variants. The invention provides use of a MGF polypeptide or polynucleotide in the manufacture of a medicament for the prevention or limitation of myocardial damage in response to ischaemia or the myocardium. The MGF polypeptide, polynucleotide or medicament is also useful for administration in response to a heart attack

                                                                                                                                                                                           The amino acid sequence of the insulin-like growth factor 1 pre-protein. Processing of the protein results in 70 amino acid mature protein is split into 4 domains: the B domain has strong homology to the B chain of insulin, the A domain similarly has homology to the A chain of insulin. These domains are separated by a C domain and the mature protein is terminated by a D domain at the C-terminus. The D domain sequence was used to synthesis peptides (AAR83801-2) that include amino acid residues 60-64 of the mature IGF-1 protein. IGF-1 binds to the IGF-1 become of IGF-1R) via the D domain and induces activation of the IGF-1R by autophosphorylation of the IGF-1R. Activated IGF-1R is associated with cellular growth and proliferation. The synthetic peptides are useful as inhibitors of IGF-1 binding to IGF-1R and thus may be used in the treatment of disorders characterised by undesirable cell proliferation eg. cancer, restenosis, asthma, burns, wounds or brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo

The method comprises delivering a nucleic acid vector for the expression of a growth factor or neurotrophic factor in a tissue or tissues. The present sequence represents human IGF-1 (insulin-like growth factor 1) which is used in the method of the invention. Due to the growth and stimulatory effects of growth factors and neurotrophic factors, introducing these factors to degenerated muscles in the urinary system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC can be used in the vector of the invention, for expression of a nucleic caid sequence in a cell, which comprises: (a) a nucleic acid cassette containing a sequence encoding IGF-I; (b) a 5' flanking region including come or more sequences necessary for expression of the nucleic acid cassette, including a promoter from a skeletal alpha-actin gene; (c) a clinker connecting the 5' flanking region to a nucleic acid, the linker chaving a possition for inserting the nucleic acid cassette, and lacking the coding sequence of a gene with which it is naturally associated; and coding region or both, where the 3' flanking region or a 3' non coding region or both, where the 3' flanking region is 3' to the position coding region or both, where the 3' flanking region is 3' to the position coding region or both, where the 3' flanking region is 3' to the position coding region or both, where the 3' flanking region is 3' to the position coding region or both and cassette and comprises a sequence from a growth hormone 3'-UTR. The vector can provide for efficient IGF-I compression, particularly in gene therapy. It can be used for the delivery of IGF-I for treating diseases such as muscle atrophy, diabetes, conting peripheral neuropathies resulting from diabetes, genetic disease such as Type I or Type II diabetes, genetic disease such as Chacot-marie-cook improvement peripheral vascular disease, haemophilia, cerebrovascular, or peripheral vascular disease, haemophilia, contents of the peripheral contents of the peripheral cancer and anti-viral drugs. The correctors can also be used to create transgenic animals for research or collectors can also be used to create transgenic animals for research or collectors can also be used to create transgenic animals for research or collectors.

The nucleic acids are used as an array of at least 2 of the 50 nucleic acids bound to a solid substrate. Also included is a solid-phase protein microarray comprising at least 2 antibodies or its antigen binding fragments, that specifically bind at least 2 different polypeptides from the 50 fully defined sequences as given in the specification, fixed to a solid substrate. The methods and arrays are useful for the diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       endometrial cancer, selecting and monitoring treatment regimes and identification of lead compounds useful for the treatment of endometrial cancer. The present sequence is one of 50 proteins differentially expressed between cancerous and non-cancerous samples

The method comprises are determining the expression of a set of human genes or expression products in an endometrial sample suspected of being cancerous. The human genes of the invention are differentially expressed in breast tumours characterised as high or low MAI (mitotic activity index). These sets of genes can be used to discriminate between high and low MAI breast tumours. The invention also provides DNA and protein microarrays for analysing the expression of the human genes and their protein products. The methods and arrays are useful for the diagnosis and prognosis of endometrial cancer, selecting and monitoring treatment regimes, and identification of compounds useful for the treatment of endometrial cancer. AAU84311-AAU84361 represent the human proteins of the invention that are differentially expressed in breast cancer tissue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         accumulation of the polypeptide in the brain of the mammal. The invention also relates to producing a central nervous system (CNS)-targeted polypeptide, identifying IGF-based peptide fragments that can reach neuronal tissue from blood, a nucleic acid encoding an IGF tag or a protein fused to an IGF tag and producing a therapeutic agent for targeting across the blood-brain barrier. The method is useful for treating lysosomal storage diseases that affect the central nervous system, e.g. Pompe disease, Tay-Sachs disease, Gaucher disease, Niemann-pick disease, Furler syndrome, Sly syndrome, Schindler disease, This sequence represents the human IGF-I polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Targeting a polypeptide to brain for treating lysosomal storage diseases, by providing polypeptide in association with insulin-like growth factor group to mammal, thus resulting in accumulation of polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel agent for preventing familial Alzheimer's disease by inhibition of apoptosis of Alzheimer V642I variant APP, comprising insulin-like growth factor (IGF)-I optionally with one or more deleted, replaced or added amino acid(s) and exhibiting apoptosis inhibitory activity. The agent of the invention may have nootropic or neuroprotective and act as an inhibitor of Apoptosis of the Alzheimer V642I variant APP. The agent is useful for preventing and treating familial Alzheimer's disease. The present sequence represents the human insulin-like growth factor protein of the invention.
New binding domain-immunoglobulin fusion protein, subject having or suspected of having a malignant
                                                                                                                                      17-JAN-2001; 2001US-0367358P.

disorder, e.g. melanoma, Grave's disease or autoimmune disease

Disclosure; SEQ ID NO 55; 157pp; English

Comprising a binding domain polypeptide, an immunoglobulin hisper region polypeptide, and immunoglobulin heavy chain (CH2 constant region polypeptide that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide, and an immunoglobulin heavy chain (CH2 constant region polypeptide) and immunoglobulin heavy chain (CH2 constant region polypeptide) derived from (CH2 constant) constant region polypeptide (CH2 constants) coysteine residues, where the first cysteine is not mutated; a contains 2 cysteine residues where the first cysteine is not mutated; a contains 2 cysteine residues where the first cysteine is not mutated; a contains 2 cysteine residues where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (CH2) contains room contains room contains room cysteine residues. The binding domain immunoglobulin hinge region on cysteine residues where the mutated human IgG1 immunoglobulin fusion protein is copable of at least one immunoglobulin hinge region polypeptide contains room cysteine residues where the mutated human IgG1 immunoglobulin fusion protein is copable of at least one immunological activity comprising antibody capable of at least cysteoxicity (ADC1) and complement fixation. The chinding domain immunoglobulin fusion protein is construct comprising the binding domain immunoglobulin fusion protein a promoter), construct comprising the binding domain immunoglobulin fusion protein, a recombinant expression of parametrical composition composition protein, a recombinant expression of the binding domain immunoglobulin fusion protein, a promoter, and is a subject having or suspected of having domain immunoglobulin fusion protein, a construct producing the binding domain immunoglobulin fusion protein, a composition composition comparising the binding domain immunoglobulin fusion protein, a cell transity of the producing an The invention relates to a binding domain-immunoglobulin fusion comprising a binding domain polypeptide that is fused to an

The IGF-1 polypeptide can be used to treat muscular disorders, e.g. Duchenne or Becker muscular dystrophy, autosomal dystrophies and related progressive skeletal muscle weakness and wasting, muscle atrophy in ageing humans, spinal cord injury induced muscle atrophy and neuromuscular diseases, and cardiac disorders, e.g. diseases where promotion of cardiac muscle protein synthesis is a beneficial treatment, cardiomyopathies and acute heart failure or insult, specifically myocarditis or myocardial infarction. It can also be used to promote bone fracture healing and maintenance of bone in old age. The present sequence represents human IGF-1 Ea isoform used in the present specification

It can be used for the treatment of retinal neuronal tissues which are suffering from the effects of injury, ageing and/or disease such as photodegeneration, trauma, axotomy, neurotoxic-excitatory degeneration, ischemic neuronal degeneration, inherited retinal dystrophy, diabetic retinopathy, Alzheimer's disease, infantile malignant osteoperosis, ceroid lipofuscosis or cholestasis. The DNA constructs are stably replicated in yeasts in which prepolypeptides form in high yield. The yeast cells are then able to process the pre-forms to the mature IGF. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                           Human insulin-growth factor, which has a new prim. structure by oxidising reduced form IGF-I and treating the obtd. cpds. chromatography, and is used for incorporating thymidine.
                                                                                    Sequence 70
                                                                                                         promoting effect. However it is on 10-MAR-2003 to add missing correct PA field.)
                                                                                                                  The IGF-I (and its salts) has strong effect for acceleration of thymidine incorporation into animal cells, suggesting that it has strong growth promoting effect. However it has no blood sugar lowering effect. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to

Analogue B retains nearly full activity at the type I IGF receptor but does not bind to serum components. It is considerably more active than wild-type hIGF-I. It is highly active as an agent to increase the yield and efficiency of milk prodn. esp. in cows. It is also used as a growth promotant, to promote wound healing and to stimulate erythropoiesis. It is produced by chemical synthesis or recombinant DNA techniques using IGF-I DNA sequences prepd. synthetically, chromosomally or by recombinant DNA techniques, to transform bacterial, yeast or tissue culture cell lines. A synthetic gene for Analogue B is claimed in Claim
                                       Human insulin-like growth factor analogues - have higher activity due we reduced affinity for serum components while retaining affinity to type
                                                                                                                                                                                                                                                                                                              Synthetic gene; human insulin-like growth factor I; lactation enhancer; growth promoter; wound healing;

Sequence 70

A

It is a synthetic polypeptide analogue of hIGF-I called IGF130 or Analogue C. Analogue C retains nearly full activity at the type I IGF receptor but does not bind to serum components. It is considerably more active than wild-type hIGF-I. It is highly active as an agent to increase the yield and efficiency of milk prodn. esp. in cows. It is also used as a growth promotant, to promote wound healing and to stimulate erythropolesis. It is produced by chemical synthesis or recombinant DNA techniques using IGF-I DNA sequences prepd. synthetically, chromosomally or by recombinant DNA techniques, to transform bacterial, yeast or tissue culture cell lines. A synthetic gene for Analogue C is claimed in Claim

Analogue D retains nearly full activity at the type I IGF receptor but does not bind to serum components. It is considerably more active than wild-type hIGF-I. It is highly active as an agent to increase the yield and efficiency of milk prodn. esp. in cows. It is also used as a growth promotant, to promote wound healing and to stimulate erythropoiesis. It is produced by chemical synthesis or recombinant DNA techniques using IGF-I DNA sequences prepd. synthetically, chromosomally or by recombinant DNA techniques, to transform bacterial, yeast or tissue culture cell lines. A synthetic gene for Analogue D is claimed in Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-JUL-1990
